How to cite this article: Santos SC, Almeida DB, Silva GTR, Santana GC, Silva HS, Santana LS. The professional identity of female nurses: an integrative review. Rev baiana enferm. 2019;33:e29003.

Objective: identifying the main findings by scientific articles on the professional nurse identity. Method: this is an integrative literature review, developed through a bibliographic research involving scientific articles on the theme. The Virtual Health Library database was used. The final sample was made up of 12 scientific publications. To analyze data, the technique of content analysis was applied. Results: the data made clear that the professional identity of nurses is related to a religious meaning, intersecting with military and professional relations of meaning, which derive from the origins of the profession. Conclusion: the professional nurse identity is strongly related to religious issues, has been influenced by military organization, and presents signs that show its objective of being recognized as a profession and a science.

Objetivo: identificar las mayores descubiertas de artículos científicos sobre la identidad profesional de la enfermera. Método: revisión integrativa de la literatura, desarrollada por medio de una investigación bibliográfica de artículos científicos sobre el tema. Se utilizó la base de datos de la Biblioteca Virtual en Salud. La muestra final se constituyó de 12 publicaciones científicas. Para analizar los datos, se utilizó la técnica de análisis de contenido. Resultados: los datos indicaron que la identidad profesional de la enfermera está relacionada con su sentido religioso y tiene intersecciones con los sentidos militar y profesional, todos derivados de los orígenes de la profesión. Conclusión: la identidad profesional de la enfermera está fuertemente relacionada con la religión, sufre interferencias de la organización militar, y presentan indicativos del objetivo de establecerse como profesión y ciencia.

Descripciones: Enfermera. Identificación social. Trabajo femenino.

Introduction

Identity, presented as a complex and broad concept, has frequently been employed to understand the introduction of a single subject in the world and its relation to itself and others. It can be understood as a source of meaning and experience for a people, a source that is not fixed or stable, but historically and socially built, and as a result, the subject of transformation. It includes the articulation of what is part of an individual and how they imagine being perceived by others.

One of the modalities of identity is the professional one, described as "[...] socially recognized ways for individuals to identify one another in the field of work and employment." A modality of identity gives specificity and characteristics to an individual, which will allow them to have a collective and social identity that is based on the possession of specific scientific and technical knowledge related to their professional field, which allows them to exercise a certain profession. Building professional identities results from the articulation between individual and collective identities. The process of professional socialization involves the acquisition of identity and the development of feelings of belonging, which are essential to the consolidation of professional identities.

When it comes to the professional identity of nurses, many studies raise questions regarding its very absence. This professional field presents many historic and social determinants that place it in a trench of social exclusion, subjection, invisibility, lack of identity of professionals who represent the profession, technically focused education, proletarian bases, with gender as its greater determinant, being related to the social construction of women.

The construction of the professional identity of the nurses must be permeated by ties of identification to the profession, sewn into their daily lives and expressed through positive and negative feelings regarding the profession. Therefore, the nurse may be recognized due to historical events related to the work they execute, gender issues, religion, and sociopolitical actions in the field of health.

Among the justifications to carry out this study, the expressive number of nursing professionals in Brazil standout: more than 400 thousand (481.281) nurses, nearly one million (1.108.774) nursing technicians, and approximately 425 thousand (426.022) nursing auxiliaries. In Bahia, the state in which the researchers developed this study, there are, on average, 33 thousand (33.026) nurses, 70 thousand (71.715) nursing technicians, and 14 thousand (14.638) auxiliaries.

However, despite the expressive contingent and the numerical relevance of nurses in the health team, their professional identity is found to be frail and filled with conflict. This also affects the quality and/or management of the care offered by these professionals, as well as in the lack of clarity these workers have regarding their essential attributions and how pivotal their position is in the work process of health, from the perspective of managers, users,
health professionals, and nursing professionals themselves\(^{(7-8)}\).

With regards to these considerations, the following research question was elaborated: What are the main findings in scientific articles regarding the professional identity of the nurses?

The objective of this article is identifying the main findings by scientific articles on the professional nurse identity.

**Method**

This is an integrative literature review, developed through a bibliographic research of scientific articles on the theme.

Integrative reviews are literature reviews that gather data from theoretical and empirical literature, including studies with different methodological approaches (quantitative and qualitative)\(^{(10-11)}\). It consists in the elaboration of a broader literature analysis, which contributes for discussions regarding methods and results of researches, leading to considerations about the performance of other investigations\(^{(12)}\). It also makes it possible to synthesize the results of many different studies and debates with regards to a specific field of knowledge\(^{(11)}\).

This type of review is capable of generating a source of updated knowledge about an issue, determining if said knowledge can be used in practice. However, it requires the adoption of methodologically rigorous standards, so that the reader can identify the main features of the studies analyzed\(^{(13)}\).

This study carried out a bibliographic survey of the Virtual Health Library (VHL). This database was chosen because, according to the premises on which it is based, it is targeted for health professionals, and involves all countries from Latin America and the Caribbeans, having one of the best collections of relevant information on the effects of health interventions. Other databases are also integrated in its scope, such as LILACS, IBECs, MEDLANE, Cochrane, and SciELO.

To be included, articles needed to: have been published from 2012 to 2017, in Portuguese, Spanish, or English, and be found via the crossing of the descriptors: identity and nursing and female nurses. The period chosen to carry out data collection — 2012 to 2017 — was chosen so the information thus found would be updated. Also, the objective of the study is finding the main results on the professional identity of female nurses which are coherent with the present times.

A total of 98 articles was found, after the following were eliminated per the exclusion criteria of this study: incomplete publications, duplicate articles, and studies that did not specifically address the prosfessional identity of female nurses. The final sample was made up of 12 scientific publications. Flowchart 1 shows the process of study selection.
Flowchart 1 – Selection of studies for the integrative review

Inclusion criteria: scientific studies published in 2012 and 2017, in Portuguese, Spanish, or English, found through the crossing of the descriptors: identity and nursing and female nurse.

Studies identified through the VHL website, from the following database:
- MEDLINE: 50
- LILACS: 34
- BDENF: 20
- HISA: 2

Studies excluded:
- Not fully available: 24
- Duplicates: 10

Studies evaluated for inclusion: 64

Studies included in the analysis: 12

Exclusion of studies that did not address the professional identity of female nurses specifically: 52

Source: Created by the authors.

To make it easier to obtain the data from each research, this study used a collection instrument based on the model proposed by Ursi and Pompeu, which allowed for the extraction of information in a systematic and efficient manner. The instrument comprised the following items: title, periodic and year of publication, name of the authors, research objectives, research methodology, and main findings (results and conclusions). The collection of the data that make up this review took place from September to October 2017.

The analysis of the research included in an integrative review is complex, requires time and knowledge from the researcher. Therefore, it must be carried out carefully, aiming to find explanations for the different or conflicting results from the many researches analyzed.

Therefore, a chart-synthesis was created, with information pertaining to each study. The content analysis technique was used to analyze the results.

Regarding the ethical aspects of this research, the authors of all studies used to elaborate the integrative review were carefully referred to, as was any other pertinent information. Since this is a review, meaning it uses only secondary data, which come from other studies, there was no need to subject this study to the appreciation of a Research Ethics Committee.

Results

In Charts 1 to 3 there is a synthesis of the articles included in this integrative review, divided according to the categories found by the content analysis.

Discussion

To better understand the categories that emerged from the analysis of the studies included in this integrative review, this discussion will start by addressing the professional identity of the nurse and its religious meaning, since this was the most frequently mentioned.

The religious meaning present in the professional identity of the nurse has its roots in the medieval era. Then, health practices were influenced by political, social and economical determining aspects of feudal societies, including its relations with Christianity. That characterized the first movement of institutionalization of healthcare and its link to priesthood and nunhood. These are the origins of Nursing as an informal practice. It was mostly developed by religious women, leaving behind a legacy that, with time, was legitimized and accepted by society as attributes inherent to female nurses(7,28).

Therefore, submission and obedience were widely addressed in most studies analyzed here, since both are marked features of the religious women who, at the time, were transferred into Nursing duties. As a result, Nursing was perceived as a profession that was hierarchically inferior and, consequently, subordinate to medicine(29).

Abnegation, devotion, dedication, the spirit to serve, and obedience were features socially attributed to the work of nurses, with the objective of giving it the features of priesthood, not of a professional practice, since these activities were focused on manual labor and based on empirical knowledge(28). Therefore, domestic and popular health actions with intense Christian mystical connotations and feelings of charity were predominant.

It stands out that, even after the professionalization of the field of Nursing, religious characteristics remained. That is because the main precursor of the profession, Florence Nightingale, would emphasize that the field activities of nursing should be understood as both a profession and a vocation. Therefore, both aspects were indissociable(30).

Being that so, authors suggest that the propagation of the original ideals according to which Nursing was female and charity-related contributed for the marginalization and lack of recognition of nurses. Thus, these professionals were destitute of social value as professionals, since they were obedient and submissive to the determinations of other health professionals. This situation, as a result, highlighted how unclear the importance of the nurses is for the
actions of the health team, patients, and society as a whole\((29,31)\).

The convergence between the professional and religious identity of the nurse has its origins in the advent of modern Nursing, which was influenced by the knowledge and practices of Florence Nightingale. At that moment, the professional and specific institutionalized practice started, and earned respect in the field of health. Therefore, it was no longer understood as a simple empirical activity, and started to be recognized as a paid profession, attending to the workforce needs of hospitals. Since then, these professionals started to need to act according to scientific knowledge\((32)\).

However, in the researches analyzed, the professionalization of the Nursing field was discussed as a practice that, despite the fact it brought a scientific approach to the field, was, for a long time, permeated by strong traces of the religious influence over the profession. This could be observed in some of the characteristics that were socially attributed to the nurses and in the features of their uniforms, which were similar to that of religious women\((24)\).

It should be mentioned that, at that time, the activities of the nurses were based on the practical dimension of techniques and administrative knowledge. That represented the working process of Nursing in a vertical technical division, a dichotomy that separates their knowledge/know-how according to formation\((33)\).

According to some authors, the Nursing model prescribed by Nightingale (the Nightingalean System) was one of the main reasons the work performed by nurses was unappreciated and vulnerable, since it imposed many demands to the nurses hired. They needed to be single, with no children, and completely submissive to the demands of health institutions and to the orders of physicians. That made it easy for the State and health services to exploit these professionals. According to one of the studies analyzed, this work was similar to that of a slave or a nun\((17)\).

The social and technical division of labor in the field of Nursing generated essential conditions to understand the construction of the identity of female nurses, since it meant that activities carried out by them were not outlined well, which, frequently, generated a mistaken perception of their activities\((17)\). This aspect was also made clear in another study, which remarked on the difficulty of Nursing students in distinguishing what were the specific activities of the female nurse, mostly associating it to features that are related to religious actions\((22)\).

The studies that address the identity of the nurse as it is associated to religious and military aspects showed that they were recruited to work in the war as voluntaries, motivated by traditional values such as submission, dedication, and devotion to the needs of the patient and the physician, having religion as the justification for this work\((17,26)\). The main activity carried out in the battlefields was the direct care for wounded soldiers, since this was understood as related to domestic work, and as such, an exclusively female attribution.

In Brazil, in 1914, during the 1st World War, the Red Cross assumed the training of voluntary nurses to aid the wounded in the war\((28)\). It should be mentioned that, once adapted to the routine of war and to the adversities of the camps, they could have learnt new cultures and technologies\((34)\).

The social division of Nursing labor was also an aspect discussed in the studies. The profession was strongly influenced by military organization, especially by the concept of a command unit that is present in the linear organization and originates from medieval armies\((35)\). That partially explains the dichotomy between thinking and doing in Nursing, something intrinsically related to the technical and social division of labor, since intellectual actions were delegated to the so called lady nurses, while manual actions were under the responsibility of nurses\((28)\), leading to a lack of appreciation for the healthcare offered by the nurse. In addition, these stereotypes contributed to disseminate the image of Nursing as a practice that is auxiliary to medicine, based on manual and disarticulated actions that derive from systematized and scientific formation\((28)\).
Based on the analysis of the many factors related to the construction of the professional identity of the nurse, it can be inferred that the current perception of their identity, when associated to the recognition of the nurses of themselves in said descriptions of identity, contributes to weaken their identities, since the actions attributed to this profession suggest a lack of completeness (the almost being), aspects that directly resonate in the self-perception of these professionals, as well as in their autonomy, personal realization, and in their recognition of Nursing as a profession.

It cannot be denied that the work of Nursing professionals is permeated by social and political processes and exchanges, which, oftentimes, make it difficult to understand the real relevance of these workers, which are often surrounded by technicism and by their occupation of many jobs, in a universe in which poor work conditions are growing. In this context, nurses suffer symbolic violence, while also practicing violence to the job categories below them in routine professional relations.

However, the broad social and economic transformations of contemporaneity imposed many changes in the world of labor, and as a result, in identities. This makes it possible for nurses, as a professional group, to reclaim new identities, that can dialectically transcend the marks of the past.

To this end, nurses must have more critical and reflexive actions when it comes to the exercise of their profession, so that they can assume an actively engaged posture in the fight for better work conditions. It stands out that, if this does not happen, the future of the Nurse will be an even more intense decrease in the wages of the workforce, accompanied by its proletarianization, leading to even more political and critical weakness of these professionals.

Conclusion

This study concludes that the professional identity of the nurse is strongly related to religious issues, has been influenced by military organization, and presents signs that show its objective of being recognized as a profession and a science. Also, it is still permeated by aspects related to the social and historical construction of the profession (gender, submission, and lack of professional appreciation).

Therefore, it is extremely important to promote discussions regarding the professional identity of the nurse in the spaces for professional formation and activity, which will contribute to build and consolidate an identity that can actually boost the social recognition and professional appreciation of the nurse.

These discussions can also favor the understanding of a Nurse’s working process and object of work, while also restating and consolidating the main role nurses has in relation to other professional categories in the field of health. A result of this would be professional engagement, including the political dimension of the profession, to offer a more humane, political, and ethical healthcare.
